

Study Design-Elif Erkan

GCTOF & lipidomics

human urine (31)

Sample Prep: Urines were frozen in -80C

Treatments: We are sending 12 patient urines with minimal change disease (MCD), 9 patient urines with focal segmental sclerosis (FSGS), and 10 urines from healthy controls

Interest: We would like to investigate if urine metabolomics can help us understand the pathophysiology of glomerular diseases. The medications that the patients are receiving and the creatinine levels are listed as an excel file and send with the samples
